LPG Pumps

ISO 9001-2008

Versa LPG pump is a self-priming side channel pump capable of handling gas along with the medium and operates at a low noise level. LPG pumps are used for problem-free pumping of clean liquids at unfavourable suction side conditions. They are also very suitable for positive suction heads below 0,5m. LPG pumps provide the most appropriate solutions for liquefied gases, liquids under vapour pressure, refrigerants and especially LPG applications.

Side channel designs fill the hydraulic performance void between positive displacement pumps and centrifugal pumps. Fully open "star" impellers interact with the side channel casing creating an intense transfer of energy to the pumped liquid or liquid / gas mixture. The corresponding pressure increase (pump head) equals 5 to 10 times the amount generated by a similar size centrifugal pump at the same RPM.
